Dear Hiring Team,

For the last decade, I've been doing data science the hard way — in FDA-regulated healthcare. That means running multi-center randomized controlled experiments across 12+ sites, pre-specifying every hypothesis, powering studies with NCSS-PASS, and defending effect sizes that decide whether a diagnostic gets Medicare reimbursement. When you're wrong in my world, patients get the wrong care, insurers stop paying, and \$10s of millions in development go to waste. That's what taught me causal inference isn't a skill — it's a mindset. A/B tests without prespecified hypotheses, attribution models without counterfactuals, funnel analyses that confuse correlation with conversion — I've spent my career fighting those failure modes.

I've spent my career at the startup end of healthcare — founding two companies, shipping production ML into CAP/CLIA environments, and iterating on forecasting models weekly — not in the waterfall pharma world healthcare is usually caricatured as. Even so, the sample sizes and feedback loops are small compared to what Marketplace Co sees every day. Site analytics, behavioral instrumentation, supplier matching, and 24/7 order fulfillment produce signal velocity I've never had access to. The JD's emphasis on "prescriptive action" over "descriptive reporting" — and platform-level A/B/n rigor across both customer and supplier experiences — is exactly what a causal inference native wants to hear.

The second reason I'm applying: I'm ready to operate AI-first, not just champion it. At CareDx, I built a custom Codex tool stack (database access, SQL generation, schema introspection) for my data science team, then drove adoption across our 20-person Data and AI org through executive sponsorship and peer training. Company-wide Copilot adoption hit 92% and saved ~8% of total hours annually. More importantly — with agents, I personally matched the output of the other five members of my team. I've internalized that the line between managing humans and orchestrating AI agents has blurred, and that effective managers are becoming the new super ICs. Marketplace Co's "prescriptive action" bar is one that agentic workflows are built for.

I'd bring a decade of rigorous experimentation muscle, a strategic bias for action, and a team culture that treats "AI-first" as operating posture rather than slogan. I'd love to apply it to the full marketplace funnel.

Best,

Ian Schillebeeckx
